

Frames

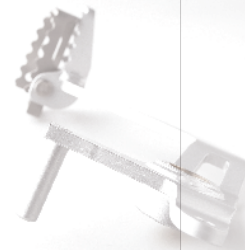

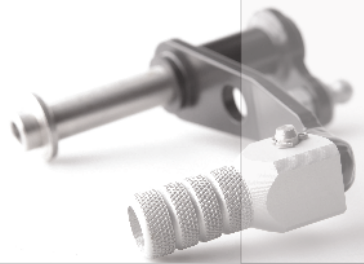

Thanks to our fifty-year long tradition in production of frames for two-wheelers and constant investments in new technologies and knowledge, we have become a re-known development supplier of components to large European manufacturers of motorcycles.

We focus on production of components for motorcycles with special emphasis on frames and other complex welded components. Our production features the following key technologies: tube bending, welding, (wet and powder) painting and assembly. The frames are made of steel, high-alloyed steel and/or aluminium alloys as a response to the trends of reducing weight in motorcycle and automotive industries. Thanks to our own development and co-operation with external institutions we may offer our customers a comprehensive support - from the development phase to the final product ready to be assembled. We have established direct communication lines with these institutions and our customers, enabling safe exchange of development and logistic data.

We have the vision we know the way.

We are co-operating and supporting our customers already well in the pre-development and then development phase of the projects, hence we have made investments in modern CAD workstations with the software Catia, Version 4 and 5. Constant investments in our key technologies are also important; thus our production features 10 welding robots and a new powder painting line. The new technology on the way, 3D CNC bending machines and laser cutting machines, will further improve our competitive position as well as further increase of our flexibility.
